Abstract

As the concept of motion is found in all languages, linguists such as Leonard Talmy show that how such a concept might be coded differently in different languages, and how languages could be typologically categorized. Motion might, thus, appear both as a simple or non-simple verb. As Persian verb category, especially non-simple verb, is a challenging topic, the present paper tried to explore Persian motion verbs based on lexicalization pattern theory, in a cognitively semantic framework. It proved that on a continuum of lexicalization extreme to satellite-frame extreme, some non-simple verbs, just like simple verbs,
